

# Final Project Proposal

**IS-680/IT-634: Introduction to Data Mining and Visualization**

Group Members: Carol Liang, James Louis, Vaibhav Mayekar, Marissa McCaffery, John Melo, & Aeraj Arib Baig Mirza

## Topic Introduction

For years it has been widely known that teacher engagement and motivation, parental engagement, and financial status has a significant impact on student academic performance. It has also been proven that an increase of usage and access to technology has had a positive impact on student performance worldwide. According to a study conducted in Portugal, students who have easier and higher rates of internet access typically have better academic outcomes (Nunes et al, 2023).

Although current research has proven the fact that the internet, parent, and teacher involvement have helped students achieve better outcomes, the current research does not speak specifically to whether parent engagement has an effect on students' study habits. Current studies also do not answer whether study habits vary by students from different financial backgrounds and if different study habits affect academic performance.

Our research will provide insight on which study habits are more effective in providing positive academic outcomes to students of a lower financial background. This research will also determine whether there is a correlation between specific study habits and academic performance, and whether this varies by financial status. Finally, this research will determine the degree to which parental engagement varies among the different financial status groups.

## Dataset Description

Dataset Source: ***Student Behavior: Understanding Students: Behaviors, Preferences, and Expectations***

<https://www.kaggle.com/datasets/gunapro/student-behavior>

The dataset utilized for this project has been sourced from Kaggle and encompasses the information of 235 university students. This dataset includes their responses to inquiries about various aspects, including their financial and academic backgrounds, as well as personal preferences related to their academic pursuits and life in general.

Within this dataset, you will find the following variables, with its details provided below:

- 1) *Certification course*: (Yes/No) if the student has completed any certification course or not.
- 2) *Gender*: (Male/Female) the gender of the student.
- 3) *Department*: (BCA/B.com Accounting and Finance/B.com ISM/Commerce) the department of field or study the student is enrolled in.
- 4) *Height*: the height of the student in centimeters.
- 5) *Weight*: the weight of the student in kilograms.
- 6) *10<sup>th</sup> grade mark*: (From 1-100 range) student's 10<sup>th</sup> grade score obtained.
- 7) *12<sup>th</sup> grade mark*: (From 1-100 range) student's 12<sup>th</sup> grade score obtained.

8) *College mark*: (From 1-100 range) student's college or university score obtained.

9) *Hobbies*: (Cinema/ Sports/ Reading books/ Video games) 4 options of habits or interest were provided for the student who took the survey to select.

10) *Daily studying time*: the amount of time that each student spends studying each day, the following time range was provided for the students to select.

- |                 |                      |
|-----------------|----------------------|
| a. 0-30 minutes | b. 30-60 minutes     |
| c. 1-2 hours    | d. 2-3 hours         |
| e. 3-4 hours    | f. More than 4 hours |

11) *Prefer to study in*: student's preferred study environment, options including the following:

- |            |          |
|------------|----------|
| a. Moring  | b. Night |
| c. Anytime |          |

12) *Salary expectation*: the expected number of salaries of the student.

13) *'Do you like your degree?' question*: (Yes/No) indicates if the student likes the currently pursuing degree or not.

14) *Willingness to pursue a career based on their degree*: (From 0% - 100% range): indicates if the student wants to work in the field that they are currently studying for in the future.

15) *Social media & video*: the time that students engage with social media platforms each day. The following time range was provided to the students to select on the survey.

- |                    |                      |
|--------------------|----------------------|
| a. 0 minute        | b. 1-30 minutes      |
| c. 30 – 60 minutes | d. 1 – 1.3 hours     |
| e. 1.3 – 2 hours   | f. More than 2 hours |

16) *Traveling time*: the travel time of students commuting to their school every day. The following time range was provided to the students to select on the survey.

- |                  |                      |
|------------------|----------------------|
| a. 0 minute      | b. 30 – 60 minutes   |
| c. 1 – 1.3 hours | d. 1.3 – 2 hours     |
| e. 2-2.3 hours   | f. More than 3 hours |

17) *Stress level*: the perceived stress level of the student. The following options were provided to the student to select.

- |         |             |
|---------|-------------|
| a. Good | b. Fabulous |
| c. Bad  | d. Awful    |

18) *Financial status*: the current financial status of the student. The following options were provided for the student to select.

- |         |             |
|---------|-------------|
| a. Good | b. Fabulous |
| c. Bad  | d. Awful    |

19) *Part-time*: (Yes/No): indicates if the student has a part-time job or not.

## **Dependent Variables and Independent Variables**

### **Dependent Variable:**

- **College Mark**: This represents the student's academic performance in their college or university, serving as the primary focus of the analysis to understand their achievements.

### **Independent Variables:**

- **Financial Status**: Students from more financially stable backgrounds might have better access to better resources and support, positively impacting academic performance and leading to higher college marks.
- **Social Media & Video**: Excessive engagement with social media and video platforms might potentially detract from study time and focus, leading to lower college marks.
- **Certification Course** : The completion of certification courses might positively correlate with higher college marks, indicating that students with additional certifications exhibit better academic performance.
- **Stress Level**: Higher stress levels might negatively impact focus and academic performance, potentially resulting in lower college marks.

# Through analysis of our dataset, our research will aim to address how financial status and study habits jointly influence academic performance.

```
# import Libraries
library(dplyr)
library(ggplot2)
library(tidyverse)

# Read the CSV file
df <- read.csv("/content/Student_Behaviour.csv")
data <- read.csv("/content/Student_Behaviour.csv", header = TRUE)
```

| A data frame: 235 x 21 |        |            |           |           |              |              |              |               |       |                  |                    |                    |                         |  |                      |                  |                  |                  |               |       |

```

The dot plot displays the frequency of time spent on a task for three groups: Blue, Green, and Red. The x-axis shows time intervals, and the y-axis shows the frequency (0 to 10). Blue dots represent the first group, Green dots represent the second group, and Red dots represent the third group.

| Time Interval     | Blue Group Frequency | Green Group Frequency | Red Group Frequency |
|-------------------|----------------------|-----------------------|---------------------|
| 0 - 30 minute     | 1                    | 2                     | 1                   |
| 1 - 2 Hour        | 2                    | 3                     | 4                   |
| 2 - 3 hour        | 1                    | 2                     | 3                   |

### 3. Does financial status correlate with study activity?

```
data <- data %>%
  mutate(Financial.Status = ifelse(Financial.Status %in% c("NA", "NA ",
NA), "Good", as.character(Financial.Status)))

data$Financial.Status <- factor(data$Financial.Status, levels =
c("Awful", "Bad", "Good", "Fabulous"))

library(ggplot2)

ggplot(data, aes(x = Financial.Status, fill = daily.studying.time)) +
  geom_bar(position = "dodge") +
  labs(x = "Financial Status", y = "Count") +
  ggtitle("Bar Plot of Financial Status vs. Study Time")
```

Financial status does not correlate with study activity. As shown from the bar plot, financial status' described as "bad" or "good" show the highest levels of study activity from students. The "Awful" and "Fabulous" financial status categories, the worst and best financial standings respectively, show the lowest levels of study activity.

#### 4. What is the relationship between student demographics and academic performance?

```
# Explore the relationship between gender and academic performance
ggplot(df, aes(x = Gender, y = college.mark, fill = Gender)) +
  geom_boxplot() +
  labs(title = "Relationship between Gender and College Marks")

# Explore the relationship between department and academic performance
ggplot(df, aes(x = Department, y = college.mark, fill = Department)) +
  geom_boxplot() +
  labs(title = "Relationship between Department and College Marks")

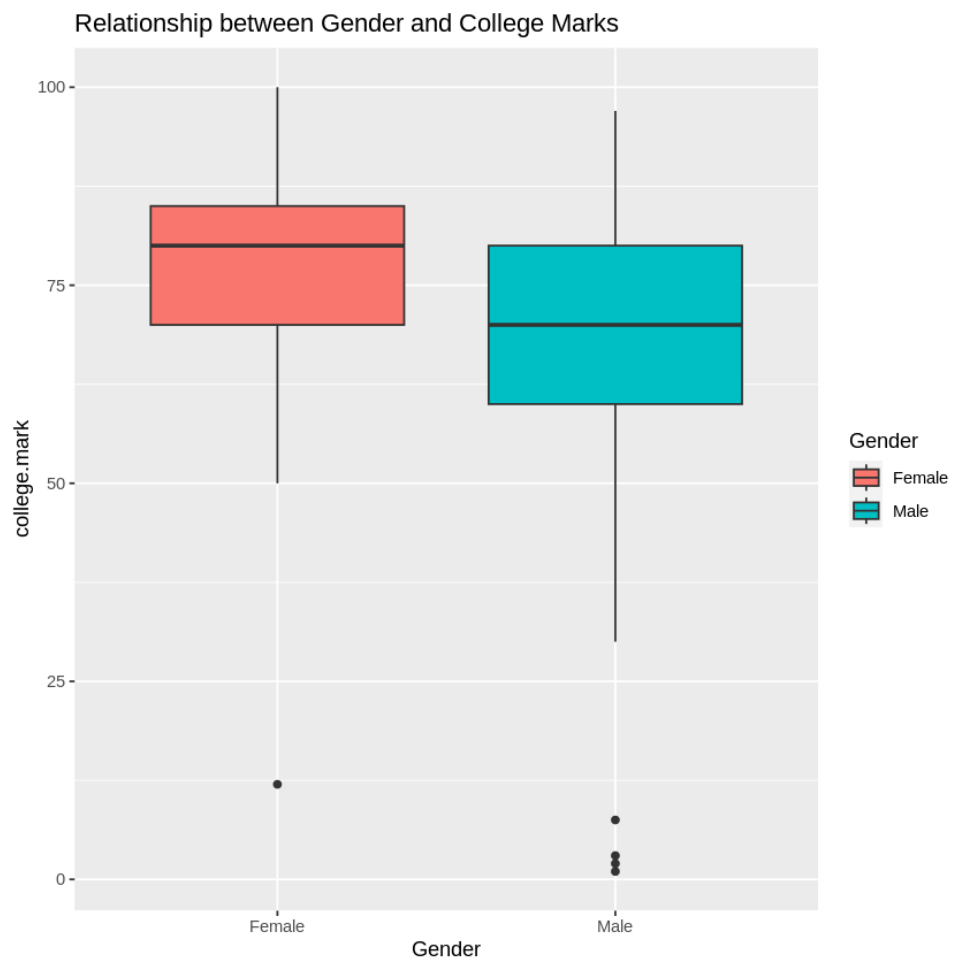

# Explore the relationship between 12thmark and academic performance
ggplot(df, aes(x = X12th.Mark, y = college.mark)) +
  geom_point() +
```

```

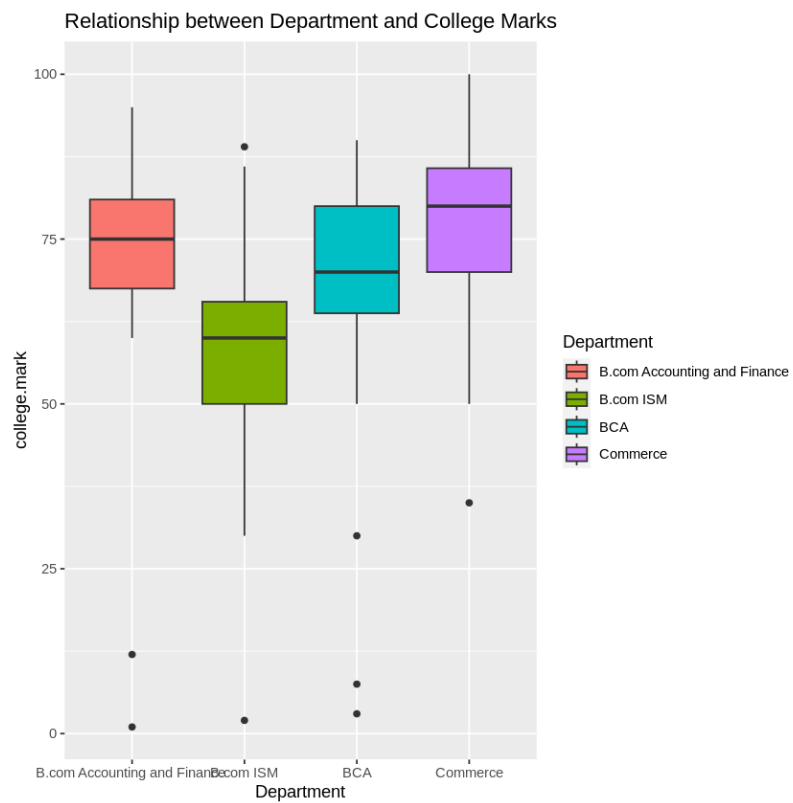

geom_smooth(method = "lm") +
labs(title = "Relationship between 12th mark and College Marks")

# Explore the relationship between financial status and academic
performance
ggplot(df, aes(x = Financial.Status, y = college.mark)) +
  geom_point() +
  geom_smooth(method = "lm") +
  labs(title = "Relationship between Financial Status and College
Marks")

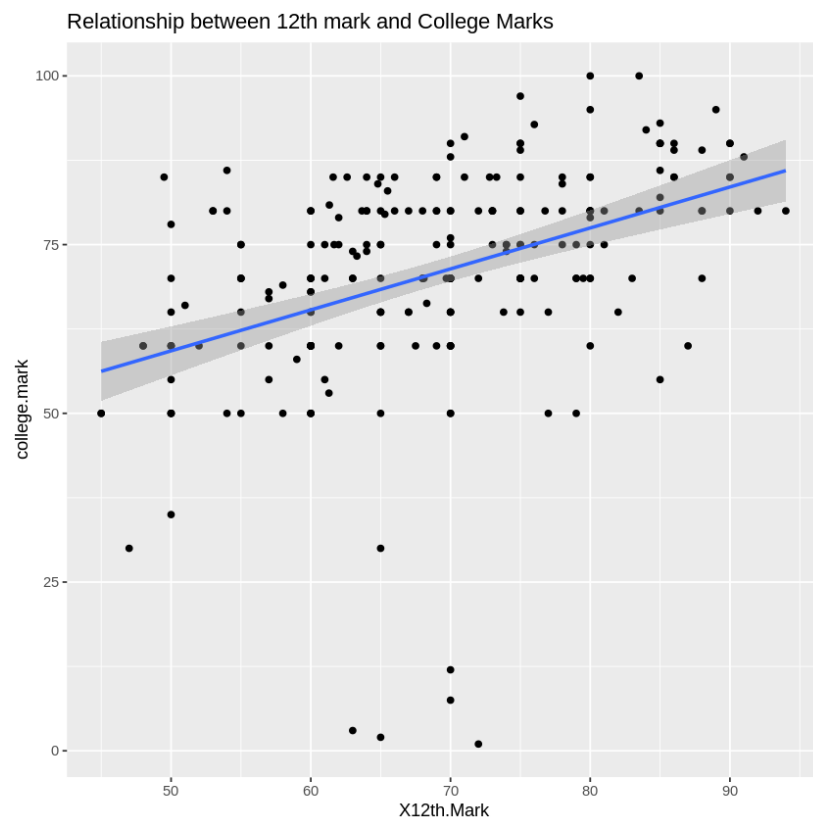

```

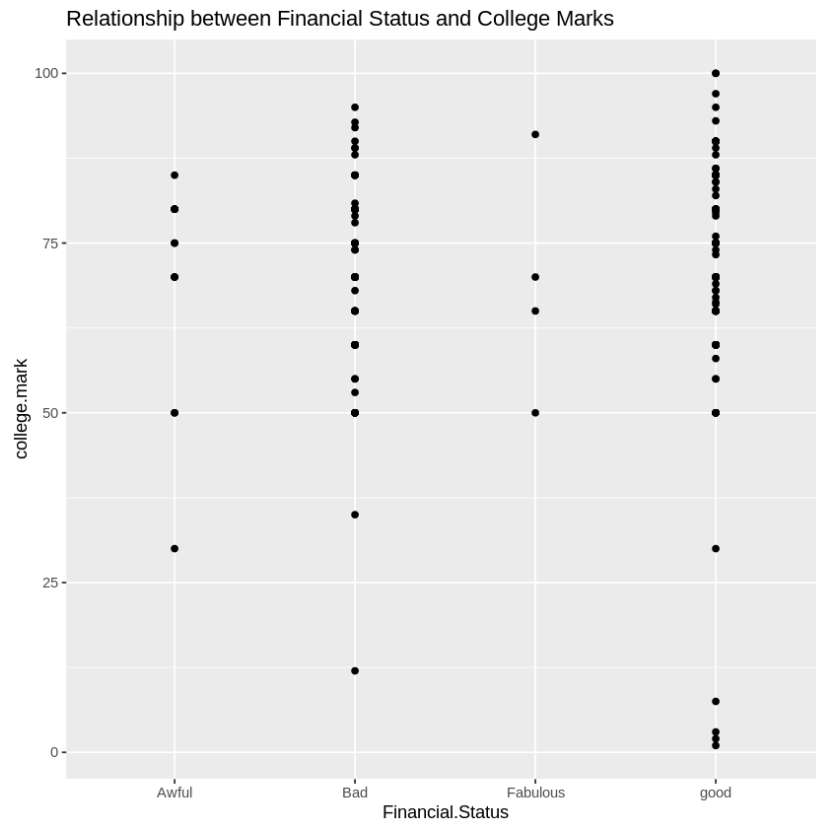

```
`geom_smooth()` using formula = 'y ~ x'
```

```
`geom_smooth()` using formula = 'y ~ x'
```

## 5. To what extent do college marks influence student stress levels?

```
# Converting Stress.Level to an ordered factor and then to numeric
df$Encoded.Stress.Level <- factor(df$Stress.Level,
                                levels = c("Awful", "Bad", "Good",
                                "Fabulous"),
                                labels = c(0, 1, 2, 3),
                                ordered = TRUE)

df$Numeric.Stress.Level <-
as.numeric(as.character(df$Encoded.Stress.Level))

# Building a linear regression model
model <- lm(Numeric.Stress.Level ~ college.mark, data = df)

# Reviewing the model summary
summary(model)
```

```

  labs(x = "Predicted Label", y = "True Label", fill = "Count") +
  ggtitle("Confusion Matrix Heatmap")
```

Our study reveals little correlation between college grades and stress levels among students. Our analysis included regression and Random Forest models. We found that college grades only account for approximately 0.36% of the variation in stress levels, indicating a weak connection. Random Forest model showing a 47.23% out-of-bag error rate. This suggests that grades are not a strong predictor of stress levels in students.

For predictive analysis, our plan involves leveraging advanced statistical models to forecast and comprehend the intricate relationships among educational factors such as study habits, financial status, and academic performance.

Here are the key steps in our predictive analysis plan:

**Feature Selection:** Identify key variables that significantly contribute to academic performance, stress levels, and other relevant outcomes. This will involve assessing the importance of each variable based on statistical methods.

**Data Preprocessing:** Clean and preprocess the data to address missing values and outliers, ensuring the reliability of the dataset.

**Model Selection:** Choose appropriate predictive modeling techniques, such as regression analysis, to consider the multifaceted nature of the academic experience.

**Cross-Validation:** Implement cross-validation techniques to identify underlying patterns.

Evaluation Metrics: Define suitable evaluation metrics to gauge the performance of the models.

Interpretation: Interpret the results of the predictive models and validate their accuracy and reliability, considering the various factors identified in the conclusion.

After observing how factors such as study habits, financial status, and academic performance influence one another, our findings highlight that daily studying time alone does not significantly impact academic success. Instead, a comprehensive mix of diverse factors, such as gender, department, 12th-grade marks, and financial status, all contribute to the typical but nuanced academic experience.

Although we observed some positive correlations between daily studying time and academic performance, the relationship between financial status and study activity contradicts that this was achieved alone. Furthermore, despite the lack of correlation between study habits and academic grades, students from lower financial backgrounds displayed higher median marks. Additionally, our investigation into the link between college grades and stress levels suggested a weak connection. College grades accounted for a mere 0.36% of the variation in stress levels, with a Random Forest model indicating a 47.23% out-of-bag error rate, highlighting the limited predictive power of grades in anticipating stress levels among students.

Conclusively, our research suggests that the conventional perspectives on the determinants of academic performance may not offer a complete understanding. There are many factors tied to academic experience that might not be considered wholly when determining educational methods and standards. A continued analysis might entail a comparison of educational methods between schools and whether or not they consider these factors.
